

ABSTRACT

A method of establishing a network connection, capable of transmitting data, from a computing device, having a network connection with an
5 existing network, to a network. The method comprises: determining whether data requested by the computing device originates within the network. If said data requested by the computing device does originate within the network, breaking at least a portion of the network connection with the existing network for the data and establishing a network
10 connection with the network for that portion of the network connection that was previously connected to the existing network.
